Security and privacy issues for electronic ID cards

Przemysław Kubiak Mirosław Kutyłowski

Wrocław University of Technology
Institute of Mathematics and Computer Science

Warsaw, 18.03.2010

Agenda

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Plan of this talk:

- 1 e-ID and privacy issues
- 2 anonymity: sector identities, restricted identification
- 3 e-signature for public administration

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

e-ID & Authentication versus Data Protection

Privacy problems

naïve implementation

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Authentication

- 1 data fields of the e-ID digitally signed by the issuer of the e-ID card
- 2 an e-ID card authenticates itself by signing a random challenge with its private authentication key

Privacy problems

naïve implementation - personal data harvesting

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Threats for signed data

uncontrolled access signed data fields collected (even illegally):

- high quality data, undeniable
- hot potato transmission protocols, untraceable thanks to P2P & crypto technology

Privacy problems

naïve implementation - personal data harvesting

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Threats for signed data

uncontrolled access signed data fields collected (even illegally):

- high quality data, undeniable
- hot potato transmission protocols, untraceable thanks to P2P & crypto technology

controlled access only authorized readers can access signatures:

- non trivial infrastructure: PKI for entitled readers, with no internal clock in e-ID cards
- is it really necessary? (online access to registries is possible)

Privacy problems

naïve implementation - authentication

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Threats of Big Brother

undeniable evidence of location of the e-ID owner:

random challenge: implemented as pseudo-random and indistinguishable from random challenge, it hides data readable for insiders

pseudo-random, verifiable: as above but readable to all

Privacy problems

naïve implementation - authentication

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Threats of Big Brother

undeniable evidence of location of the e-ID owner:

random challenge: implemented as pseudo-random and indistinguishable from random challenge, it hides data readable for insiders

pseudo-random, verifiable: as above but readable to all

A more general problem

- strong cryptography on tiny artefacts itself is a threat
- high quality undeniable data available where so far gathering data on a massive scale was hard or impossible

General Approach

zero knowledge protocols

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Zero-knowledge protocols

- 1 authenticate with a secret stored in the device
- 2 challenge response protocol, but easy to create fake protocol transcripts:
 - when executed, the protocol yields a good proof for the current participants,
 - when presented afterward to the third party, it is useless

General Approach

zero knowledge protocols

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Zero-knowledge protocols

- 1 authenticate with a secret stored in the device
- 2 challenge response protocol, but easy to create fake protocol transcripts:
 - when executed, the protocol yields a good proof for the current participants,
 - when presented afterward to the third party, it is useless

Problems

- zero-knowledge protocols are quite universal...
- but “heavy” and not practical in most cases

Positive example

Static DH authentication

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Authentication protocol

- e-ID holds a secret x and a certificate of public key $y = g^x$
(all computations in a group with hard DL problem)
- protocol steps:
 - 1 the reader generates a at random, computes $z = g^a$ and sends z to the card,
 - 2 the e-ID computes $K := F(z^x)$
 - 3 the reader computes $K := F(y^a)$
 - 4 the reader and the tag communicate over a channel encrypted with K ,
implicit authentication by correct decryption

note that:

$$z^x = (g^a)^x = (g^x)^a = y^a$$

Positive example

Static DH authentication

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Zero-knowledge properties

- 1 in order to compute the session key K , the e-ID card has to know the secret key x
- 2 it is quite easy to create the transcript of a session – it suffices to write the responses of the e-ID by himself!

Data protection

- 1 relatively easy, transcripts of communication have no proof value for the third party,
- 2 authentication convinces that data told by an e-ID holding a secret key confirmed by the issuer

Disadvantage

- 1 protection is based on memory protection

Security &
Privacy of e-ID

P.Kubiak, M.

Sector Identities

Sector Identities

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Requirements

- 1 owner of an e-ID card authenticates himself against diverse systems,
- 2 identities of the same person in different sectors should be unlinkable
- 3 in particular, the sector identities should be unlinkable to the ID of the owner

Applications

- 1 access to medical data,
- 2 contact with law enforcement authorities,
- 3 eBay, allegro, ...
- 4 ...

Austria

sketch of the solution

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Symmetric solution - automatic way of deriving sector logins

ID for each sector computed from the personal ID number, sector ID and the secret key of the authority

$$ID_{i,s} := H(i, s, K)$$

recomputed on the fly by a central authority
solution analogous to ATM PIN mechanism

Disadvantages

- 1 replay attack
- 2 impersonation attack (by the recipient)

Germany

restricted identification, main protocol

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Main properties

- 1 strong mutual authentication based on a three-step procedure: PACE, terminal authentication, chip authentication
- 2 sector ID

Discussion

- 1 rather heavy
- 2 finally anonymity is limited

Lightweight Restricted Identification

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Keys

- 1 each e-ID holds a single secret key x for many sectors,
- 2 a sector S holds a base key g^r , for $r = r_S$
- 3 the public keys used in the sector with the base key g^r derived as

$$y_1^r, y_2^r, \dots$$

from the public keys of the e-ID owners:

$$y_1, y_2, \dots$$

Authentication

- 1 static DH
- 2 public key y_i^r and private key x used

Lightweight Restricted Identification

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Mediated
solutions

Unlinkability issues

problem given the lists y_1, y_2, \dots and y_1^r, y_2^r, \dots after sorting them,
is it possible to link any y_i with y_i^r ?

linking DH Problem security question reduces to Linking Diffie-Hellman Problem:

given $g^r, (g^a, g^b)$ and g^{z_1}, g^{z_2} where
 $\{g^{z_1}, g^{z_2}\} = \{g^{ra}, g^{rb}\}$
find i such that $g^{ra} = g^{z_i}$.

Lightweight Restricted Identification

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Unlinkability issues

reduction it can be formally proved that

**Linking Diffie-Hellman Problem can be broken
iff**

**Decisional Diffie-Hellman Problem can be
broken**

corollary the construction does not introduce any new
threat.

- 3 finalization keys f_1, f_2 generated **independently** from n, e, d
- 4 the private key d updated to $d' = d - (f_1 + f_2)$
- 5 integer d' placed in the **signing card**, f_1 in the **laptop** of the owner, f_2 in the remote mediator server

Mediated signature *mRSA*

signing and verification

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Signing procedure

- 1 to sign m use the card and d' in the regular way (if $d' < 0$ then $s' = ((\text{padding}(m))^{|d'|})^{-1} \bmod n$), send the result s' to the laptop
- 2 the laptop uses f_1 and sends $s'' = s' \cdot (\text{padding}(m))^{f_1} \bmod n$ and $\text{padding}(m)$ to the mediator server
- 3 the mediator server uses f_2 and creates the final signature $s = s'' \cdot (\text{padding}(m))^{f_2} \bmod n = (\text{padding}(m))^d \bmod n$

Verification

standard RSA, use the public key

Mediated signature *mRSA*

security features

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Physical security

In order to create a signature against the will of the owner it is necessary to:

- 1 steal the crypto card
- 2 steal the laptop
- 3 break into mediator server (when the user blocks)

Mediated signature *mRSA*

security features 2

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Disabling

In order to disable signing possibility:

- 1 block it in the laptop (login + password necessary to unblock), and/or
- 2 block it in mediator server (password+ presence of the E-ID card necessary to unblock)

Monitoring

supervision systems blocking/suspending suspicious transactions

(e.g. requests coming from different IP's at the same time)

Mediated signature *mRSA*

security reduction

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Formal security proof

reduction security of *mRSA* in the form presented can be reduced to standard RSA

corollary *mRSA* as secure as RSA

Key privacy

key usage all keys MUST be used to create a signature,
compromised card exposing d shows neither f_1 nor f_2
in the standard RSA d shows everything and
the scheme completely broken

compromised laptop exposing f_1 shows no information on d
and f_2

compromised mediator server exposing f_2 shows no
information on d and f_1

Hash chain

The mediator server may store cryptographic/physical/published logs of the operations performed so that:

- 1 existence of a transaction undeniable even if crypto broken after some years
- 2 no way to *sign in the past*

Mediated signature *mRSA*

signing time

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Undeniability of signing time

- 1 The mediator server refuses to finalize signature if declared signing time not fresh.
- 2 traces left in the hash chain.

Verification

- 1 just execute RSA verification

Mediated signature *mRSA*

comparison with Oasis DSS

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Features

- 1 unlike classical X.509 solutions both guarantee signing time
- 2 VA-DSS incorporates any signing scheme as plug-in, mediated architecture trivial for RSA but requires more complicated computing procedure for DSA
- 3 VA-DSS quite heavy (like any universal tool)
- 4 obviously, one can incorporate fields from VA-DSS to mediated signature, if needed (time stamp,...)

Mediated signature *mRSA*

comparison with DSA, ECDSA

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Mediated signatures with DSA

- 1 formal security proofs are published
- 2 modifications in the signing procedure less trivial, require 2 HSM's instead of one (this method)

Long time security

general situation

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

Perspectives of long time security

- 1 from scientific point of view advances in cryptanalysis unpredictable
- 2 computing power more predictable, but this is not decisive here due to high security margins
- 3 any **guarantees** are not honest, **recommendations** (like formulated by German authorities) are just orientation point and can change rapidly
- 4 the system **must be prepared to rapid changes** (e.g. freezing all e-ID cards until the case is cleared)

Long time security comparisons

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

DSA, ECDSA, RSA

hard to say which technology will last longer

- 1 no serious results showing definite advantage of one technology over the other one
it is an area of science fiction
- 2 DSA and ECDSA practically harder to audit since failure of randomness means immediately key exposure,
it is mathematically impossible to prove that a string is random

Conclusions

Security &
Privacy of e-ID

P.Kubiak, M.
Kutyłowski

Traces

Sector
identities

Mediated
solutions

- 1 re-using the approach designed for qualified signatures for some crucial components of e-ID seems to be the worst solution
- 2 practical security level can be much higher than for the classical solutions
- 3 the users should have the right to use mediated solutions

Thanks for your attention!
