## Idea of advanced electronic signature

- a signature linkable with its signatory
- technically, signing is performed by some (yet unspecified) electronic means controlled by the signatory
- no undetected changes in a document possible after signing

# EU legal concept of electronic signatures

## EU Directive 1999/93/EC, Art. 2

”advanced electronic signature” means an electronic signature which meets the following requirements:

- (a) it is uniquely linked to the signatory;
- (b) it is capable of identifying the signatory;
- (c) **it is created using means that the signatory can maintain under his sole control;** and
- (d) it is linked to the data to which it relates in such a manner that any subsequent change of the data is detectable;

## EU Directive 1999/93/EC, Art. 2

**certificate:** a) it is uniquely linked to the signatory;

**certificate:** b) it is capable of identifying the signatory;

**secure device:** c) it is created using means that the signatory can maintain under his sole control; and

**cryptography** d) it is linked to the data to which it relates in such a manner that any subsequent change of the data is detectable;

*can maintain* – sloppy behavior of the signatory does not reduce his responsibility

## SSCD

- "signature-creation device" means configured software or hardware used to implement the signature-creation data;
- "secure-signature-creation device" . . . meets the requirements laid down in Annex III;

## ANNEX III

1. Secure signature-creation devices must, by appropriate technical and procedural means, ensure at the least that:
  - (a) the signature-creation-data used for signature generation can practically occur only once, and that their secrecy is reasonably assured;
  - (b) the signature-creation-data used for signature generation cannot, with reasonable assurance, be derived and the signature is protected against forgery using currently available technology;
  - (c) the signature-creation-data used for signature generation can be reliably protected by the legitimate signatory against the use of others.
2. Secure signature-creation devices must not alter the data to be signed or prevent such data from being presented to the signatory prior to the signature process.

# Concepts for SSCD

Verifiability

Feasibility

Proposed Framework

Common Criteria  
Security Levels  
Evaluation Rules

## Generic solutions: smart card

- carefully designed and limited operating system,
- the keys can be used to generate a signature, but not read by the card holder,
- tamper resistant
- some (weak) authentication of the user against the card

## Generic solutions: keys locked on a server

- no electronic device hold by the user, the keys stored on a secure server
- keys used after rather reliable authentication of the user
- successful in practice!

where to keep the money: in a bank or in a pocket?

# SSCD - checking properties

Verifiability

Feasibility

Proposed Framework

Common Criteria  
Security Levels  
Evaluation Rules

## Certification concept

Devices checked by special institutions/companies:

- confidential information checked, so it cannot be open for inspection by public
- specialized know-how and labs for testing
- independence from the manufacturer – no personal, economic, . . . connections

## Certification limitations

- a manufacturer can know more tricks than an inspector
- inspection by a check-list only
- **instead of trusting the manufacturer we have to trust a certification authority**

# Attacks - geopolitic situation

Attacks and Threats

Verifiability

Feasibility

Proposed Framework

Common Criteria  
Security Levels  
Evaluation Rules

## Cyber-war

- attack methods: may be see only the top of an iceberg
- strong financing of cryptanalysis in some countries, state control over research results

## Generic attacks

- 1 low quality randomness
- 2 using random parameters as hidden channels
- 3 tricks with key generation
- 4 hardware trapdoors

Verifiability

Feasibility

Proposed Framework

Common Criteria  
Security Levels  
Evaluation Rules

## The concept

- **no expert knowledge is required to evaluate relevant security mechanisms,**
- evaluation results should be self-evident and undeniable,
- effectiveness of security mechanisms can be checked while the system is running and not only as a prior inspection,
- no assumption is made about honesty of any party of the protocol, it concerns in particular the manufacturers and supervision authorities.

Evaluation Rules

## A SSCD with a Two-Head Dragon

- 1 a good dragon with two heads lives in a smart card, one head per side
- 2 a signature is created by one of sides, selected at random
- 3 during signature creation the head from the active side says a half of a magic formula
- 4 once the whole formula is said, the secret keys are revealed

If the keys get compromised and used, then why the secret keys are revealed to the public.

## Idea

An adversary holding the secret key cannot use them!

# A framework for “sole control”

Security Levels  
Evaluation Rules

## Common Criteria Approach

### Methodology

- 1 find questions for key issues,
  - 2 define security levels for possible answers
  - 3 examine a solution and assign it appropriate level
- it is not generally true that we need the highest level in each category
  - we do not have to be paranoid - we need to adjust the solutions to real risks!

Evaluation Rules

## Key Issues

- 1** to what extent does the signatory depend on honesty of the third parties? What are the potential consequences of malicious behavior of these parties?
- 2** In what way can the signatory transfer the sole control to other parties, if he wishes to do so (or is coerced to do so)?
- 3** Is the sole control evident to the signatory, or is it merely a technical fact that can be checked by third parties?

Security Levels  
Evaluation Rules

## Trust levels

**TRUST-0** :  
the signatory has to trust blindly the system providers

**TRUST-1** :  
it suffices to trust certification and auditing bodies supervising the system of digital signatures

**TRUST-2** :  
the signatory does not have to trust any third party

# Criteria for “sole control”

## Transferability of control

### **TRANSFER-0** :

the signatory may transfer the possibility of creating signatures to a third person without substantial effort

### **TRANSFER-1** :

transfer of sole control is detectable with substantial probability

### **TRANSFER-2** :

transfer of control is impossible neither by technical nor organizational means

## Quality guarantees

### **GUARANTEE-0** :

“sole control” is based on a declaration of the system provider

### **GUARANTEE-1** :

“sole control” is confirmed by certification bodies and runtime audits

### **GUARANTEE-2** :

“sole control” is self-evident in the sense that any breaches can be recognized at least by the signatory and are undeniable

## Signatory's control over the keys

### level CONTROL-0 :

the signatory has no record about usage of signature creation data, especially those created without his consent

### level CONTROL-1 :

the signatory has access to data indicating actual usage of the signature creation data

### level CONTROL-2 :

the signatory has access to data proving actual usage of the signature creation data in undeniable way
